

It's a 24/7 world and your business should never stop.

But it will.

Power failures, virus attacks, harddrive corruption - even a spilled cup of coffee can mean months of data lost from the people who drive your business and the computers that hold 80% of your corporate data.

It's easy to back-up a data center or a bank of servers. Backing up dozens of different desktops and notebooks, scattered across regional offices coupled with thousands of individual security issues is tedious, time-consuming and patchy at best.

Until RediSafe. Designed for business users and real world conditions, with industrial-grade security and privacy, RediSafe is everything you need to back up your most sensitive, rapidly changing and vital data in just one box. A solution that works seamlessly with multiple operating systems, across your network, that needs near-zero maintenance and practically runs itself.

Install it in under half an hour. Set it up on your computers in minutes. Then forget about it. RediSafe will automatically back-up all your business data in the background.

More disk space needed? Need a mirror for disaster recovery? Just plug in another box.

The question is: how fast will you be back in the game?

Right before the big client meeting, disaster strikes and weeks of work vanish. No frantic calls to the IT department, no scramble for CD back-ups that are already out of date. Just open the web-based RediSafe client and restore the missing data in minutes.

Thanks to RediSafe's storage scalability, you can cover anyone from branch offices to top executives to the entire company. RediSafe's integrated hardware and software appliance means robust performance and near-zero daily administration for the lowest total cost of ownership with absolutely no compromise in security.
